CS 115 Exam 2, Spring 2013

Your name: _____________________________________________

Rules

• You may use one handwritten 8.5 x 11” cheat sheet (front and back). This is the only resource you may consult during this exam.

• Explain/show work if you want to receive partial credit for wrong answers.

• As long as your code is correct, you will get full credit. No points for style.

• When you write code, be sure that the indentation level of each statement is clear.

Problem 1: Tracing code (20 points)

What will print to the screen when each of the following snippets of code is executed in IDLE?

Be very clear with spacing, line breaks, etc.

Note: the parts of this problem are independent.

(a)
```python
for j in range(3):
    for k in range(2):
        print(k)
```

(b)
```python
date = "April 2 2013"
d = date.split()
print(d[2])
print(date[2])```
(c)
    month = "April"
    for i, c in enumerate(month):
        print(i, c)

(d)
    months = ["June", "July", "August"]
    print(len(months))
    print(months[1:])
Problem 2: 15 points.
What will print to the screen when each of the following snippets of code is executed in IDLE?

Be very clear with spacing, line breaks, etc.

Note: the parts of this problem are independent.

For all parts of this problem, assume that the following functions have been defined.

def f1( ):
    return 6

def f2(x):
    return x / 2

def f3(s):
    return s == s.upper()

def f4(x, y):
    return f2(y) + x

(a)
print(f1())

(b)
print(f4(6, 30))

(c)
if f3("JANUARY"):
    a = f2(6)
else:
    a = f2(100)
print(a)
Problem 3: Defining functions (40 points)

Define functions to perform the following tasks.

Keep in mind the following:
• Your functions should NOT ask the user for input.
• Your functions should NOT print anything.
• Your functions should NOT call sys.exit() to terminate the program.

(a) Define a function called perim_sq that...
• has one parameter: the side length of a square
• returns the **perimeter** of the square.

(b) Define a function called contains_q that...
• has one input parameter: a string
• returns True if the string contains the letter Q (uppercase or lowercase), and False otherwise.
(c) Define a function called \texttt{first_double} that...
\begin{itemize}
  \item has one input parameter: a string
  \item returns the first double letter (or character) in the string, or returns the empty string if there are no double letters.
\end{itemize}

Double letters (or characters) are 2 or more adjacent, identical characters.

Here are some examples:
\begin{itemize}
  \item If the string is \texttt{"bubble"}, the function should return \texttt{"b"}.
  \item If the string is \texttt{"bookkeeper"}, the function should return \texttt{"o"} (since the \texttt{\textquote{\textprime}o\textquote}} is the first double letter).
  \item If the string is \texttt{"fuzZy"}, the function should return an empty string. That is, the \texttt{z/Z} pair do not count as double letters.
  \item If the string is \texttt{"sucCess"}, the function should return \texttt{"s"}. That is, it should ignore the mismatched \texttt{c/C} pair and consider the \texttt{\textquote{s}} to be the first double letter.
\end{itemize}
(d) Define a function called `count_letter` that...

- has two input parameters: a string and a character
- returns the number of times the character occurs in the string. For example, if you pass it "success" and "s", it should return 3, since the character "s" appears 3 times in the word "success".
Problem 4: A complete program (25 points)

For this problem, you must write a complete program. That includes a docstring, a def main(), any necessary library imports, etc.

Read the instructions carefully before you start coding! If you get stuck, try to maximize your partial credit.

Your program should contain the following:

1. The definition of a function called check_user_string that:
   - takes a string as its input parameter
   - returns True if the string contains at least 3 words and False otherwise

2. The definition of a function called get_user_name that:
   - does not have any input parameters
   - repeatedly prompts the user for his/her full name until the user enters a string that contains at least 3 words
   - calls check_user_string to check each of the user’s entries

3. A main function that
   - Calls get_user_name to get the user’s full name
   - Prints the user’s name in both of the following formats:
     - Firstname M. Lastname
     - F. M. Lastname

Details:
   - If the user has multiple middle names, you should print all of his/her middle initials.
   - Be sure you include periods and spaces after the user’s initials.

Here is a sample input and output sequence, with the user's input italicized and underlined.

What is your name? John
Error: enter your full name. hobbit guy
Error: enter your full name. John Ronald Reuel Tolkien
John R. R. Tolkien
J. R. R. Tolkien
