CS 115 Exam 1, Spring 2014

Your name: ____________________________

Rules

• You may use one handwritten 8.5 x 11” cheat sheet (front and back). This is
  the only resource you may consult during this exam.

• Explain/show work if you want to receive partial credit for wrong answers.

• As long as your code is correct, you will get full credit. No points for style.

• When you write code, be sure that the indentation level of each statement is
  clear.

Grade (instructor use only)

Problem 1: Tracing code (40 points)
What will print to the screen when each of the following snippets of code is executed in IDLE?

Be very clear with spacing, line breaks, etc.

Note: the parts of this problem are independent.

(a)
```python
a = 5
b = 2
c = 10
c += a
print(a, b, c)
```

(b)
```python
x = 5 ** 2
y = x // 4 + 1
print(x, y)
```
(c)
    for k in range(6):
        print(k)

(d)
    x = 100
    for i in range(3):
        x = x - i
    print(x)

(e)
    q = 100
    if q < 2:
        print("dog")
    elif q >= 0:
        print("cat")
    else:
        print("mouse")
(f) 

```python
a = 4
b = 10
if a < 0 or b > 0:
    print("dog")
if a < 0 and b > 0:
    print("cat")
if not(a < 0):
    print("mouse")
```

(g) 

```python
for i in range(4):
    for j in range(3):
        print(10 * i + j)
```
Problem 2: Short snippets of code (30 points)
Write snippets of code to do the following. Your code should only print the requested output. You will lose points for printing additional output.

You can assume that all your snippets are enclosed within a main function and that any necessary libraries have been imported. You only need to write the specific lines of code that accomplish each task.

Do not use sys.exit() in your solutions to this problem.

(a) The formula for the area of a circle with radius $r$ is
$$\pi r^2$$
Ask the user for the area of a circle, and tell them the radius. You may assume that they enter a positive number.

(b) Ask the user to enter 1000 integers. You can assume that the user only enters valid integers.
After the user has entered all 1000 integers, print the number of values they entered that are multiples of 7. For example, 7, 14, and 21 are multiples of 7, but 8, 4, and 13 are not.
(c) Ask 200 students to enter their favorite TV show. After each student enters their input, compliment their taste if they agree with you, and insult them (semi-politely, please) if they do not.

Here is a (partial) sample of what your program might do, if your favorite show is *Mad Men*. The user’s sample input is *italicized and underlined*, as usual. You don’t have to match this output exactly.

What is your favorite TV show? *Here Comes Honey Boo Boo*  
No. Just no.  
What is your favorite TV show? *Mad Men*  
Cool. We can be friends.  
What is your favorite TV show? *Game of Thrones*  
No. Just no.  
...

...
Problem 3: A complete program (30 points)

For this problem, you must write a **complete program**. That includes a docstring, a `def main()`, any necessary library imports, etc.

Read the instructions carefully before you start coding! If you get stuck, try to maximize your partial credit.

*You can assume that all user inputs to this program are integers.*

Your program should do the following:
1. Ask the user to enter the number of lab assignments in a class. If that number is not positive, print an error message and exit the program immediately.
2. Prompt the user to enter each lab grade, using the assignment number (e.g. “Lab 4”) If a grade is not between 0 and 100, print an error message and exit the program immediately.
3. Once all the grades have been entered, print the following items:
   • The average (mean) grade
   • The maximum grade
   • If the user’s grade never dropped from one lab to the next, congratulate them! For example, if there are 5 lab grades, you should congratulate the user for the grades 90, 90, 90, 90, 90. But you should do nothing for the grades 91, 92, 93, 85, 94 (since the user’s Lab 4 grade slipped).

Here is just one example input/output sequence. The user’s sample input is *italicized and underlined*, as usual. Your output should match the sample exactly for this input.

```
Number of labs: 3

--- Lab 1 ---
Grade: 70

--- Lab 2 ---
Grade: 80

--- Lab 3 ---
Grade: 90

Average: 80
Max: 90
Great job!
```
Write your Problem 3 code here.
